

TrailWeigh Prompt 026R R2

Mobile Wedge Layout - Strict Desktop Isolation

This visual version embeds the three screenshots referenced by the text prompt. The written requirements remain authoritative if a screenshot conflicts with them.

PRIMARY MOBILE DESIGN REFERENCE

Main visual direction: elegant left-side wedge, category icon, refined cards, compact summaries, and the vertically stacked expanded-item treatment with Weight / Quantity / Total / Move.

Mobile-Wedge-Primary-Reference.png

SECONDARY MOBILE STYLE REFERENCE

Use for wedge silhouette, collapsed-card proportions, spacing, icon scale/alignment, and rhythm only. The horizontal ITEM / QTY / WEIGHT table is NOT authoritative; do not introduce horizontal scrolling to imitate it.

Mobile-Wedge-Secondary-Reference.png

PROTECTED DESKTOP BASELINE

This is the desktop presentation that 026R must preserve. Mobile wedge work must not alter the desktop toolbar, category layout, sidebar, spacing, geometry, typography, controls, or behavior.

Desktop-Editable-Baseline.png

FULL 026R R2 GOLD STANDARD PROMPT

The following is the complete text prompt. The three screenshots above correspond to the filenames cited below.

TRAILWEIGH — PROMPT 026R — GOLD STANDARD
MOBILE-ONLY ELEGANT WEDGE CATEGORY LAYOUT
STRICT DESKTOP ISOLATION

INTERNAL VERSION ID:
026R-MOBILE-WEDGE-STRICT-DESKTOP-ISOLATION-2026-08-14-R2

RECOMMENDED REPLIT SETTINGS
- Agent mode: Economy
- Work mode: Build
- Fresh Agent thread recommended
- Auto-apply OFF

ESTIMATED SCOPE
- 10–20 minutes
- approximately \$0.80–\$1.80 Agent usage
- STOP rather than broaden

=====

AUTHORITATIVE USER DECISION

=====

Implement the new elegant mobile wedge layout.

CRITICAL:
THIS IS A MOBILE-ONLY PRESENTATION CHANGE.

The normal desktop TrailWeigh website is a protected baseline and must remain visually and functionally unchanged unless this prompt explicitly says otherwise.

USER requirement:
“keep it isolated from the website”

Interpretation:
- mobile changes must be isolated behind responsive/mobile-only rendering or styling
- desktop must not inherit mobile wedge markup/layout/styling
- shared data/state logic may remain shared
- desktop presentation must not be redesigned
- do not make “one shared layout that happens to wrap differently”
- use an intentional mobile presentation branch/breakpoint where needed

=====

CURRENT VERIFIED BASELINE TO PRESERVE

=====

026Q is USER VERIFIED PASS.

Preserve:
- normal TrailWeigh owner list is editable
- obsolete owner View/Edit/Done mode remains removed
- Checklist is the separate checkable-list experience
- category-item checkboxes determine which category items appear in Checklist
- Checklist shows only selected category items
- Checklist-use checkmarks persist until Clear
- Clear does not alter category-item selection
- Print/Share operate on the filtered Checklist
- Review sandbox isolation
- Review Add Category restored
- 026K main-category accordion behavior
- sidebar accordion behavior
- Locker
- Save / Save As
- themes/backgrounds
- Keep It Simple
- desktop toolbar/layout/spacing/geometry

=====

AUTHORITATIVE VISUAL REFERENCES

=====

Three screenshots are supplied with this prompt.

1. `Mobile-Wedge-Primary-Reference.png`
PRIMARY MOBILE DESIGN REFERENCE.

Use this as the main visual direction for:
- elegant left-side category wedge
- category icon inside the wedge
- refined card proportions/radius/shadow

- category title + compact summary
- expanded category treatment
- vertically stacked item identity/details
- Weight / Quantity / Total / Move stacked inside the expanded item
- overall polished, calm, premium mobile feel

This is the closest reference to the user's intended mobile layout.

2. `Mobile-Wedge-Secondary-Reference.png` SECONDARY STYLE REFERENCE ONLY.

Useful for:

- wedge silhouette
- category-card spacing
- collapsed-category proportions
- icon scale/alignment
- visual rhythm across multiple categories

IMPORTANT:

The horizontal ITEM / QTY / WEIGHT table shown inside the expanded category in this secondary image is NOT the required item-detail layout.

The user prefers the vertically stacked expanded-item presentation from the PRIMARY reference.

Do not introduce horizontal scrolling merely to imitate the secondary screenshot.

3. `Desktop-Editable-Baseline.png` PROTECTED DESKTOP BASELINE.

This screenshot documents the normal editable desktop site after the obsolete owner View/Edit gating is out of the way.

026R must NOT redesign this desktop presentation.

Use this screenshot for before/after comparison and desktop-isolation evidence.

HOW TO INTERPRET THE SCREENSHOTS

The mobile screenshots are DESIGN REFERENCES, not instructions to replace the entire TrailWeigh application shell.

DO copy/adapt:

- wedge category visual language
- icon-in-wedge treatment
- elegant card construction
- vertical mobile item-detail organization
- compact category summaries
- polished mobile spacing and touch-friendly proportions

DO NOT automatically copy:

- mockup-only bottom navigation
- mockup search button
- mockup plus button
- mockup header structure
- mockup Base Weight dashboard card
- any control or data field that TrailWeigh does not currently have
- any behavior that conflicts with current verified TrailWeigh functionality

Preserve TrailWeigh's actual controls, data, and workflows.

The screenshots guide presentation only.

If the screenshot conflicts with an explicit requirement in this prompt:

THE WRITTEN REQUIREMENT WINS.

If PRIMARY and SECONDARY references conflict:

THE PRIMARY REFERENCE WINS.

PRIMARY VISUAL DIRECTION

For MOBILE only, use the elegant wedge category design.

The preferred direction is shown in `Mobile-Wedge-Primary-Reference.png`.

The preferred direction is:

- polished
- compact
- visually elegant
- category-driven
- easy to use one-handed
- category colors/icons help identify sections quickly

MOBILE CATEGORY HEADER:

Each main category becomes a refined wedge-style accordion header.

Required visual content:

- category icon
- category name or identifying text where space allows
- compact selected/packed count or equivalent existing category summary
- category weight summary if that category currently shows one
- open/close chevron or equivalent accordion affordance

The wedge should feel like one integrated control, not a collection of floating buttons.

=====

CATEGORY COLORS + ICONS

=====

Normal/Creative mobile mode:

- each category may have its own distinct category color
- category icon should visually correspond to category
- use color + icon + text/label where practical
- do not rely on color alone for meaning

The icon system must NOT be backpacking-only.

It must be extensible to general TrailWeigh list use, including examples such as:

- backpack
- tent/shelter
- sleep
- clothing
- water/hydration
- electronics
- toiletries
- med kit
- repair kit
- food/consumables later
- suitcase/luggage
- documents
- car/road-trip
- business
- home/general
- custom categories

Do not create the full future list-template system in 026R.

Only ensure the mobile category icon architecture is not hardcoded to hiking-only categories.

=====

KEEP IT SIMPLE

=====

Keep It Simple remains an accessibility/display mode.

On MOBILE in Keep It Simple:

- do NOT use decorative colored wedges
- preserve the established plain treatment:
 - white background
 - black text
 - flat controls
 - minimal borders/dividers
 - no decorative shadows/gradients/textures/background art
- accordion behavior remains the same
- mobile structure may still be compact/stacked, but visually simple

Do not alter desktop Keep It Simple.

=====

MOBILE CATEGORY ACCORDION BEHAVIOR

=====

Preserve the established main-category accordion rules:

Normal manual interaction:

- only one category open at a time
- opening one closes another open category
- zero-open is allowed
- tapping an open category closes it

Preserve the existing main-category joined Open/Close control:

- down arrow = Expand All / Open All
- up arrow = Collapse All / Close All
- acts only on main categories
- remains independent from sidebar Open/Close control

Do not alter desktop accordion behavior or desktop control placement.

=====

EXPANDED MOBILE CATEGORY CONTENT

=====

When a mobile category opens, its category items should use a compact mobile-first layout rather than the desktop horizontal row.

Preferred structure:

- item identity/name prominent
- item type/sub-type below or adjacent where appropriate
- Weight
- Quantity
- Total
- Move/category action where currently supported
- delete/edit controls as appropriate for normal editable owner list
- category-item selection checkbox remains available

The identifying/item information should be STACKED vertically rather than forced into the desktop horizontal row.

Avoid horizontal page scrolling.

If an existing field is not needed on phone:

- do not delete its underlying data
- hide/reposition only when explicitly justified by mobile usability
- preserve desktop field display

MOBILE ITEM DETAILS

Use a compact nested-detail or accordion treatment for item metadata if needed.

Goal:

- category item remains easy to scan
- common item identity is visible immediately
- less-common fields can expand vertically
- touch targets are comfortable
- no tiny desktop-form controls squeezed into phone width

Do not invent new data fields.

MOBILE TOOLBAR / TOP AREA

Preserve current mobile functionality while adapting presentation cleanly.

Do not remove:

- Checklist
- unit controls
- Background
- Share
- Locker access
- Scan Gear List
- Pack Summary
- Weight Distribution
- existing Open/Close controls

Do not reintroduce Edit/Done.

Do not alter desktop toolbar.

If mobile controls must be repositioned for the wedge composition:

- change mobile-only layout
- preserve functionality
- do not duplicate actions unnecessarily

TOOLTIPS / HELP FOR NEW MOBILE CONTROLS

Standing TrailWeigh requirement:

- preserve ALL existing tooltips exactly
- do not rewrite existing tooltip text
- any NEW interactive control introduced by 026R must receive a help/tooltip explanation
- keyboard-focus users must be able to access the help
- mobile/touch users need an equivalent because hover is unavailable
- do not launch a global tooltip rewrite in 026R

If current tooltip infrastructure already supports this:
reuse it.

If it does not:
limit work to the new/changed 026R controls and document any broader gap for later.

STRICT DESKTOP ISOLATION

THIS SECTION IS MANDATORY.

DESKTOP IS PROTECTED.

At desktop breakpoint:

- category headers remain in current desktop form
- category rows remain in current desktop form
- toolbar remains in current desktop form
- sidebar remains in current desktop form
- widths remain unchanged
- spacing remains unchanged
- typography remains unchanged
- controls remain unchanged
- no wedge graphics
- no mobile stacked rows
- no mobile icon/color treatment leaks into desktop
- no mobile-specific reordering of sections
- no desktop behavior changes

Implementation guidance:

- prefer an explicit mobile render branch or mobile-specific component layer where necessary
- if shared components are used, isolate presentation through breakpoint-scoped classes/props with zero desktop impact
- do not alter shared base CSS selectors in a way that changes desktop
- do not rely on broad selector overrides that affect all viewports

If a proposed implementation cannot guarantee desktop isolation:

STOP and report before editing.

=====

RESPONSIVE TARGET

=====

Mobile behavior applies across supported mobile operating systems.

Do NOT use:

- iOS-only logic
- Android-only logic
- user-agent sniffing

Use responsive viewport/layout logic.

Test representative widths:

- 320 px
- 375 px
- 390 px
- 430 px

At >= existing desktop/lg breakpoint:

- desktop baseline must render unchanged

Use the existing shared URL.

Do NOT create a separate mobile URL.

=====

TOUCH BEHAVIOR

=====

Current HTML5 drag-and-drop is not reliable for touch devices.

026R may improve MOBILE item/category reordering only if it can be done safely and within scope.

If adding a touch-compatible reorder interaction would materially broaden the task:

- do NOT implement it
- preserve existing behavior
- document as a separate future task

Do not change desktop drag-and-drop behavior.

=====

CHECKLIST PROTECTION

=====

Do not change Checklist semantics.

026R is a visual mobile layout prompt, not a Checklist architecture prompt.

Preserve:

- category-item selection controls
- filtered Checklist membership
- separate Checklist-use checkmarks
- persistence-until-Clear
- Print filtering
- Share filtering

If mobile Checklist itself requires only responsive styling to remain usable:
that is allowed.

Do not change its data/state model.

=====

REVIEW / SHARE PROTECTION

Preserve Review sandbox behavior.

The same mobile responsive presentation may be used in Review if it naturally uses the shared

ChecklistContent architecture, but:

- owner data must remain isolated
- reviewer mutations must remain sandboxed
- Review Add Category remains available
- do not fork a separate Review data architecture

Desktop Review presentation must not be changed by the mobile wedge work.

OUT OF SCOPE

DO NOT implement:

- Create New List guided questions
- Backpack / Custom list-type flow
- optional Weight architecture
- future travel/business templates
- global tooltip rewrite
- cross-device Checklist sync
- Last Synced
- server Checklist persistence
- polling/WebSockets/SSE
- database/schema/API/auth changes
- Share architecture redesign
- Print redesign
- Locker redesign
- desktop wedge design
- desktop category color redesign
- desktop toolbar redesign
- unrelated refactors
- package changes
- `replit.md`
- `.replit`
- `.agents/memory`
- deployment/publishing

PRE-EDIT AUDIT

Before editing:

1. Read `replit.md` READ-ONLY.
2. Inspect current desktop and mobile render path.
3. Identify:
 - main category header component
 - GearCategory
 - GearRow
 - mobile toolbar/render branch
 - desktop breakpoint rules
 - Keep It Simple presentation
 - existing category icon mapping, if any
4. Determine whether mobile/desktop currently share identical markup.
5. Choose the smallest architecture that guarantees desktop isolation.
6. Record expected changed files before editing.
7. Record preflight git status.
8. Create:
 - `workflow-reports/PROMPT\_026R\_REPORT.md`

CHANGED-FILE CONTROL

Expected application files should be the minimum subset of:

- `artifacts/pack-checklist/src/pages/Checklist.tsx`
- `artifacts/pack-checklist/src/components/GearCategory.tsx`
- `artifacts/pack-checklist/src/components/GearRow.tsx`
- one mobile-specific component/style file if needed

Prefer creating a mobile-specific presentation component over destabilizing the desktop component if that is safer.

If more application files are required:

STOP and explain before broadening.

After edits:

- list every changed file
- inspect full diff
- verify no desktop-only selectors/classes were unintentionally changed
- revert unrelated changes only

MANDATORY RUNTIME TESTS

SOURCE AUDIT ALONE IS NOT PASS.

TEST 1 – MOBILE 375 PX

Expected:

- wedge category headers visible
- category colors/icons present in Creative mode
- single-open accordion works
- zero-open works
- category items stack vertically
- no horizontal page scroll
- touch controls reachable

TEST 2 – MOBILE 390 PX

Expected:

- same behavior
- no clipping/overlap
- toolbar usable
- sidebar/panels usable

TEST 3 – MOBILE 320 PX

Expected:

- graceful narrow-phone behavior
- no destructive overlap
- category identity remains understandable

TEST 4 – MOBILE 430 PX

Expected:

- layout remains mobile
- no premature desktop layout
- no excessive unused space

TEST 5 – KEEP IT SIMPLE MOBILE

Expected:

- simple flat white/black presentation
- no decorative category color wedges
- same accordion behavior
- usable stacked category-item layout

TEST 6 – DESKTOP BASELINE

At desktop width:

Expected:

- NO wedge layout
- category headers unchanged
- category rows unchanged
- toolbar unchanged
- sidebar unchanged
- spacing unchanged
- no mobile icon/color leakage

Use `Desktop-Editable-Baseline.png` as the protected desktop reference for before/after screenshot comparison.

TEST 7 – DESKTOP FUNCTIONAL

Expected:

- owner editing works
- Add Item/Add Category works
- drag/reorder behavior unchanged
- Checklist works
- Locker/Save works

TEST 8 – CHECKLIST MOBILE

Expected:

- category-item selection still determines filtered Checklist
- Checklist-use marks persist until Clear
- Clear works
- no state-model regression

TEST 9 – REVIEW MOBILE

Expected:

- mobile wedge presentation works if shared
- Review Add Category still works
- owner original unchanged

TEST 10 – TOOLTIP/HELP

For any NEW 026R interactive control:

Expected:

- pointer/hover help where applicable
- keyboard-focus access
- mobile/touch equivalent
- existing tooltip text unchanged

TEST 11 – CONSOLE

Expected:

- no new errors caused by 026R

If any runtime test cannot be performed:

mark NOT RUN.

Do not claim PASS from source inspection.

=====

EVIDENCE REQUIRED

=====

Provide:

- mobile screenshot at 375 or 390 px with several categories, compared against `Mobile-Wedge-Primary-Reference.png`
- mobile screenshot with one category expanded
- mobile Keep It Simple screenshot
- desktop screenshot proving unchanged desktop baseline
- optional short video for accordion/touch interaction if easy
- exact list of changed files

The desktop screenshot is mandatory evidence for isolation.

=====

STOP CONDITIONS

=====

STOP instead of improvising if:

- mobile implementation requires broad desktop component rewrite
- desktop visual changes appear
- shared CSS causes desktop leakage
- Keep It Simple requires unrelated redesign
- touch reordering requires major new library/dependency
- package changes become necessary
- Checklist state model would need changes
- Review isolation would need changes
- work materially exceeds 20 minutes / ~\$1.80

=====

MANDATORY REPORT

=====

Complete:

`workflow-reports/PROMPT\_026R\_REPORT.md`

Include:

1. internal version
2. Replit mode
3. time/actions/lines/cost
4. preflight git status
5. files inspected
6. current mobile/desktop render architecture
7. chosen isolation strategy
8. expected changed files
9. actual changed files
10. mobile wedge implementation
11. category color/icon implementation
12. mobile item stacking implementation
13. Keep It Simple mobile behavior
14. tooltip/help treatment for new controls
15. 320 px result
16. 375 px result
17. 390 px result
18. 430 px result
19. desktop screenshot/result
20. desktop functional regression result
21. Checklist regression result
22. Review regression result
23. tests NOT RUN
24. console result
25. rollback guidance
26. unresolved issues
27. USER VERIFICATION = PENDING

=====

FINAL STATUS

=====

Return:

MOBILE WEDGE LAYOUT IMPLEMENTED = PASS / FAIL / NOT RUN
MOBILE CATEGORY COLORS/ICONS = PASS / FAIL / NOT RUN
MOBILE CATEGORY SINGLE-OPEN = PASS / FAIL / NOT RUN
MOBILE ZERO-OPEN = PASS / FAIL / NOT RUN
MOBILE EXPAND/COLLAPSE ALL = PASS / FAIL / NOT RUN
MOBILE ITEM DETAILS STACKED = PASS / FAIL / NOT RUN
MOBILE HORIZONTAL PAGE SCROLL = YES / NO / NOT RUN
KEEP IT SIMPLE MOBILE PRESERVED = PASS / FAIL / NOT RUN

DESKTOP WEDGE UI PRESENT = YES / NO / NOT RUN
DESKTOP CATEGORY LAYOUT CHANGED = YES / NO / NOT RUN
DESKTOP TOOLBAR CHANGED = YES / NO / NOT RUN
DESKTOP SIDEBAR CHANGED = YES / NO / NOT RUN
DESKTOP SPACING/GEOMETRY CHANGED = YES / NO / NOT RUN
DESKTOP FUNCTIONAL REGRESSION = YES / NO / NOT RUN

CHECKLIST SEMANTICS CHANGED = YES / NO / NOT RUN
CHECKLIST PERSISTENCE CHANGED = YES / NO / NOT RUN
REVIEW ISOLATION CHANGED = YES / NO / NOT RUN
REVIEW ADD CATEGORY REGRESSION = YES / NO / NOT RUN
LOCKER/SAVE BEHAVIOR CHANGED = YES / NO / NOT RUN

EXISTING TOOLTIP TEXT CHANGED = YES / NO
NEW INTERACTIVE CONTROLS HAVE HELP = YES / NO / NOT RUN
KEYBOARD HELP ACCESS = PASS / FAIL / NOT RUN
MOBILE TOUCH HELP ACCESS = PASS / FAIL / NOT RUN

DATABASE/API/AUTH CHANGED = YES / NO
SYNC/LAST-SYNCD ADDED = YES / NO
CREATE-NEW-LIST FLOW CHANGED = YES / NO
PACKAGE FILES CHANGED = YES / NO
REPLIT.MD CHANGED = YES / NO
.AGENTS/MEMORY CHANGED = YES / NO
DEPLOYMENT CHANGED = YES / NO
UNRELATED FILES CHANGED = YES / NO
MATERIAL UNCERTAINTY REMAINS = YES / NO

USER VERIFICATION = PENDING

=====

FINAL SELF-AUDIT

=====

Before internal PASS:

1. Is the wedge UI truly mobile-only?
2. Did desktop remain visually identical?
3. Did desktop behavior remain identical?
4. Did I avoid broad shared-CSS leakage?
5. Did category accordion behavior remain correct?
6. Are mobile category items vertically organized?
7. Are category colors/icons accessible and extensible?
8. Is Keep It Simple still simple?
9. Did I preserve Checklist semantics?
10. Did I preserve Review isolation?
11. Did I preserve Locker/Save?
12. Did I preserve existing tooltip text exactly?
13. Did new controls receive keyboard + touch-accessible help?
14. Did I avoid Create New List/template/sync work?
15. Did I avoid DB/API/auth/package/deployment changes?
16. Did I runtime-test desktop isolation?
17. Did I inspect every changed file?
18. Is any material uncertainty unresolved?

If unresolved:
DO NOT claim PASS.

=====

ZIP

=====

Create:
`workflow-reports/trailweigh-026R-report.zip`

ZIP must contain only:
`PROMPT\_026R\_REPORT.md`

Verify ZIP opens.

=====

FINAL STOP

=====

STOP after report + ZIP.
Do not proceed to Create New List.
Do not proceed to 026S.
Do not perform other waiting TrailWeigh work.
